

REMOVABLE RETROREFLECTIVE MATERIAL

ABSTRACT

A disposable retroreflective tape is described that has a pressure-sensitive adhesive that can be comfortably adhered to human skin. The tape includes a foam or non-woven backing. Retroreflective beads are melted into a first side of the backing using a laminator. A second side of the backing is coated with the pressure-sensitive adhesive material. The retroreflective beads melted into the first side of the backing to provide the disposable tape with a retroreflective surface without the use of an additional adhesive or resin.
